ABSTRACT

The present invention provides an inactive Ca²⁺/calmodulin-dependent protein kinase IIα (CaMKIIα) knockin animal in which only the protein kinase activity of CaMKIIα has been specifically impaired. Since CaMKIIα is considered to be involved in higher brain functions including learning and memory, and inhibit epileptic seizure and brain disorders caused by ischemia, the inactive CaMKIIα knockin animal of the present invention is widely usable for various studies of the brain and nerve, such as the studies of mechanisms of learning disability, dysmnesia, epileptic seizure and brain disorders.
